PROJECT PROPOSAL GUIDELINES

Overview

For the first time in your undergraduate program, you are required to propose a larger project and to carry it out to completion. In teams of two to four students, you will be working on the common project but individual team members will be required to take on responsibilities for specific work for which each will be held accountable. Interaction, collaboration and assistance are allowed and expected, but each person will receive an individual mark for his/her work performed in the project.

The Project Proposal is a concise group document that

- summarizes what you want to do, why, and what you hope to accomplish by the end of the school year,

- assesses the feasibility of the project including a review of skills and resources required, an initial work plan, and the key risks and anticipated challenges

Your goal is to provide enough reasoned information so that both your supervisor and administrator can understand what you are doing and the approach you will be taking. Using this information your supervisor and administrator should be able to understand the project well enough that we can help you to detect any serious issues and to address them during or prior to the design review meeting. You should realize the purpose of this and of every document you produce, and create and produce the necessary document elements and structure to fulfill that purpose.

A good project proposal takes time to develop and involves the entire team, the supervisor, and the administrator, and you will probably find that it is not easy to generate this document. A popular misconception is that 'all this writing' takes one away from the 'real' design. In truth, producing this document will force you to work on your ‘real’ design all along, only at the most abstract, system level which is quite new and unfamiliar for most students and new engineers.

Get as much help as you can from your supervisor. Remember, however, that it is ultimately your project and that you, not your supervisor, are accountable for it. It may be helpful to think of your team as a consulting firm with your supervisor as the ‘expert client’ who has a good understanding of the problem and the background, and your administrator as your manager who is monitoring your team’s progress and performance.

Applying ECE298 System Design

The Project Proposal represents ‘the first steps’ in the design process you learned in ECE298 System Design and will apply to your design project. Where possible, we will refer you to relevant sections of the ECE298 Course Notes (available as a BlackBoard document). For instance, ‘the first steps’ refers to the System Concept stage [ECE298 Notes, Chapter 3]. You can also consult the book, Design for Computer and Electrical
Engineers by J. Eric Salt and Robert Rothery (available on a short loan basis in the Engineering Library) or other design process books.

**Submitting Multiple Drafts: Your Proposal as an Evolving Document**

Your project will typically evolve and change considerably during the writing of the project proposal. To help you develop and think through your work, you will submit three successive drafts (see the master schedule for when these are submitted):

1. **Draft A:**
   - Not graded but feedback provided by administrator. An evaluation (based only on the required elements) will be given to provide you some idea of how marking is done in the course.
   - Focus: overall project goals, project scope, feasibility
   - This is your first attempt. Many sections will be vague, and some sections such as the System-level overview, may be missing altogether. The intention here is to get you started on thinking about the many facets of your design project and to point out any concerns early on the design cycle.
   - At this point, we don’t expect you to have
     - completed all the background research,
     - come to an actual design or solution,
     - finalized your project goal and requirements as you continue to develop your project and its scope.

2. **Draft B:**
   - Not graded but feedback is provided by the Engineering Communication Centre.
   - To be submitted before Draft A is returned. As such, we don’t expect you to incorporate comments provided by the administrator. Rather, the intention of Draft B is to give you feedback for your initial work plan and to specifically comment on the writing and presentation aspects of your proposal. It also gives you the opportunity to refine and edit the first draft for clarity and purpose.

3. **Final Draft:**

   By the final draft, the group has had considerable time to plan out the project and to address any concerns raised in the earlier drafts. This version will be the subject of the design review meeting with your administrator and (if available) your supervisor, and will be graded by both of them.

   - **Expectations at the Design Review Meeting:**
     - background research complete
     - a proposal for a system design which will be defended and discussed by your team
     - not a final detailed design, although the approach for detailed design should be understood
     - understanding of possibilities and alternatives

*Updated Oct 6, 2008*
It is fully understood that the final design could differ from this proposal as the details are worked out and the execution begins.

**Document Format**

The project proposal contains the following sections in the order given below.

- Evaluation form (1 page)
- Cover page (1 page)
- Executive Summary (1 page)
- Table of Contents (1 page)
- Body of Proposal: Figure 1 shows the sections to be included in the body. As mentioned, Drafts A and B do not need to be complete but you should at least attempt to include the sections marked. (15 pages MAX, excluding Gannt chart and full-page diagrams)
- References
- Appendices: (for final draft only)
  - Appendix A: Student-supervisor agreement form
  - Appendix B: Draft B Evaluation Form (completed by ECC)
  - Appendix C: Report Attribution Table
  - Appendices D, E, etc.: Supplemental appendices (optional, max. 15 pages)

Figure 1: Sections to be included in each Project Proposal draft.

Updated Oct 6, 2008
The format for the document is as follows: single-sided 8½” x 11” paper size, minimum 0.75” margin all around. The minimum font size for the main text must be 12 pt. **Double line spacing must be used for all body text.** Note on marking: Marks will be lost if documents are incorrectly formatted or length is excessive.

A hardcopy and electronic copy of the document in Adobe® Portable Document Format (PDF) must be submitted. The due date and location for submitting the hardcopy can be found [here](#). A description of how to convert an electronic document into a PDF can be found [here](#). The instructions for electronically submitting a document can be found [here](#). Beforehand, you should determine if your supervisor will want a separate hardcopy.

**Example Project Proposals**

Click [here](#) for some sample outlines of project proposals. These examples are drawn from past student reports, and illustrate how the general guidelines can be applied to a variety of design projects. The technical details have been removed in order to highlight the report structure and organization as opposed to the technical content or writing style. You should NOT blindly copy the examples, but use them to design your own best techniques for presenting, transferring and arguing the information about your project.

**Section Details**

The following sections provide details on each section of the document.
Evaluation Form and Cover Page

Use the table below to find the appropriate Evaluation form/Cover page for your document draft. The evaluation forms should be placed at the front of the document and student must fill out their personal information at the top of the form.

Table of Evaluation Forms and Cover Sheets

Executive Summary (max. 1 page)

This section summarizes the overall project and provides highlights from each section of the document. It should be concise, professional and must stand alone.

Because of the last point, the Executive Summary should not make any reference to other parts of the document.

NO: "A preliminary budget is included in the report."

YES: "The estimated budget for this project is $300."

Table of Contents (1 page)

List all the sections (Do not include the Table of Contents or cover pages in this listing!) and their corresponding page numbers, including sub-sections when appropriate.

Project Description

Background and Motivation

This section is aimed at demonstrating your team’s understanding of the technical problem and ‘the big picture’. Provide a background, context [ECE298, chapter 4] and motivation for your project. Give us a sense of the current state-of-the-art. What currently exists and how could it be improved? Why is the project important? What benefits could your work be to the field or to society? Is there a market for your ideas? Benefits could arise in many forms such as greater reliability, lower cost, greater ease of use, etc.

Understanding the problem in the context of the bigger picture requires that you do a literature search, and you should be prepared to put in enough time to build your case.
Provide relevant references to original sources of information. References to webpages (like Wikipedia) are generally inadequate, unless they can be justified (e.g. datasheet for components). Wherever possible, reference original sources such as journals, books, and technical standards, and provide complete information in a standard format (Refer to examples from IEEE on the course website.)

**Previous Background Work** (if applicable)

Many uncertainties about risks are answered in the course of working on a problem. In this respect, groups that have actively worked on their project over the summer have a key advantage, and so should briefly highlight some of the key challenges they have already overcome. Evidence here provides strong support of the feasibility of the remainder of the project. These groups can include some of their previous work as an attachment in the appendix.

**Project Goal**

The project goal is a statement that summarizes what your design project is to achieve. It can be general and non-technical but should give direction to the entire project. You may need a few attempts to reach a clear project goal, and your goal may also change as your project develops. Refer to [ECE298, Section 3.2] to find both good and bad examples of project goal statements. Two key points are to focus on the desired result, not the solution or implementation, and to establish some criteria for which the success of the project can be evaluated.

Design projects can take many forms. There are those that have hard functional goals but the details of the methodology are left undefined. An example of this type is the building of a 68000 microprocessor simulator. Another type, common to research-oriented projects, is a feasibility study or experiment where the result of the study is not known, however the setup of the study is a hard functional goal. Such projects may be somewhat harder to define but must meet the same requirements for verifiable project goals. One aid in these cases is to think of what has to be specified to guarantee that another team could exactly duplicate the experiment.

**Setting an Appropriate Scope for your Project**

One of the major challenges when setting the project goal and requirements in the early stages of a project is in establishing an appropriate scope for the project. A common mistake is to be too ambitious and to set a scope that is too broad initially, and to be forced to repeatedly redefine the project until the final result has only a small resemblance to the initial proposal. On the other hand, setting a scope that is too limited will affect your evaluation if the project is considered too easy or trivial (e.g. setting up a simple web site). Be realistic: your design project is one of five courses in each semester. As such, each student is expected to spend about a full day a week on it. For group of three, this represents about 500 hours of work over the school year. In industry, this would translate to an effort of about 3 person-months. What can you realistically expect that your team will accomplish in the given time, with the given resources?
Set out a clear scope for your project. Point out the team's key contributions to the final result, and then take advantage of outside resources for the rest. There is no need to implement everything from scratch. Utilize existing resources off the web, commercial software and hardware, resources provided by your supervisor, the Design Centre, etc. to look after aspects of your project that lie beyond the scope of your own work. The key is to make clear what work is yours (original) and what work is borrowed (and to properly acknowledge or reference that work).

Sometimes, it is helpful to explicitly state what parts of the final system actually lie outside your project. For instance, if you are designing the controller for an airplane, you might comment that testing your controller in a real airplane is outside the scope of your project and that you plan to use a commercial flight simulator instead for testing and the final demonstration.

A note concerning research projects: Research projects are, by their nature, less likely to follow a specific path. The “project” in the research is the process, not the result. For example, a team in a previous year investigated the use of lasers to produce optical pathways in plastic. Their project proposal outlined their initial approach to the problem: The equipment they would use, the constraints they had, the preparation of the samples, the sources of errors and the techniques they would use to discover and to minimize this errors. Over the year the experiments were adapted as they found new information and as they refined and altered their techniques. These changes were expected, but they could be done only because they had a good initial grasp on the problem and potential methods of attacking it. Eventually this team found some very important results, but they were evaluated on the process they used, independent of their success in the experiments.

Research project groups should work closely with their supervisors to first define a clear research question (embedded in the project goal), then draw up a plan on how to carry out the investigation, and provide clear, verifiable requirements for each phase of the investigation that can be used to confirm the group's progress. In this way, it is possible to successfully achieve the project goal in a research project even if no clear answer is found to the original research question.

**Project Requirements**

Provide a list of target project requirements which will be used to evaluate the success of your project. Project requirements can be divided into three categories [ECE298 notes, Section 5.2]:

- Functional requirements
- Constraints
- Objectives

**Functional requirements** and constraints should be clearly worded in pass/fail terms and in a way that can be verified, which implies a corresponding set of verification tests will be needed as discussed in the next section. Project objectives, unlike functional requirements and constraints, are not intended to be pass/fail in nature, but are used to
indicate the desirable aspects of the final design. The number of requirements depends largely on the project, but at this early stage, the list should not be very long, but enough to capture the essence of your project. The point is to be complete, but not to constrain your design unnecessarily. Use the Requirements Checklist in [ECE298 notes, Section 5.4] to guide you. Here is an example table:

<table>
<thead>
<tr>
<th>Project Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output: 10.0 +/- .2 V, max. current 10A.</td>
<td><strong>Functional requirement</strong>: output specification of power supply</td>
</tr>
<tr>
<td>Size: maximum 10 cm x 10 cm x 2 cm</td>
<td><strong>Constraint</strong>: This is the size of the available space in the target vehicle</td>
</tr>
<tr>
<td>Manufactured cost (in thousands): $250 or less</td>
<td><strong>Constraint</strong>: A higher cost will make the item unprofitable through reduced sales.</td>
</tr>
<tr>
<td>Minimize weight</td>
<td><strong>Objective</strong>: the lower the better (weight not significant below 100 grams)</td>
</tr>
</tbody>
</table>

**Notes on requirements:**

- Requirements should be free of implementation details. (e.g. Yes: ‘The unit shall determine the highest frequency component in the signal’. No: ‘The unit shall have an A/D converter and microcontroller, which determines the highest frequency component in the signal.’) [ECE298 Notes, Section 5.4].
- Take care to phrase functional requirements and constraints in a way that can be verified (e.g. 'it must be yellow' or 'it must weigh less than 1 kg'). There are some common words/phrases that are often used but which should be avoided. Some examples and ways of circumventing the problems associated with the use of these words/phrases can be found [here](#).
- Briefly relate each requirement back to the original project goal in order to show the connection.
- Some requirements may not directly relate to the final result but may be necessary for testing or other intermediate goals (e.g. ‘create a user interface to monitor and modify the state of the state machine.’). See [ECE298 Notes, Section 5.4] for both good and bad examples.
- For Research Projects: If you are doing a research project, determining the project requirements may be more difficult. Consider the following questions with the help of your supervisor:
  - What would we need to specify in order to get a research grant?
  - What would we need to specify in order that someone else could repeat this research and get the same results? This is a key requirement for publishing research.
For example, a recent project (an award winner!, already mentioned) involved forming optical light channels in plastic using a focused laser to change the refractive index of a path through the plastic. Some of the requirements for this project would concern

- the types of plastic(s) that would be investigated for this use
- the type of laser(s), power setting(s) and focus setting(s) that would be investigated
- the other equipment that would be needed, including the equipment used to test the success of the methods used.
- The types of experiments and test results required to characterize the performance of the fabricated devices.

Clearly, because it is a research project, all of the answers are not known, including how successful the effort will be. However, even negative results are important in research and still indicate a successful project. Also, very important in research will be the risk strategies which you will start to develop in this document. What would you do if the initial plastic selected did not work?

**Validation and Acceptance Tests**

In this section, describe how you would validate your final design and prove that it satisfies the project goal and requirements [ECE298 Notes, Chapter 13]. Consider how you would demonstrate your successful project at the final Design Fair. Alternatively, if you were the paying customer, describe the tests you would perform to quality this device before buying this product? Provide details where possible, including the test equipment, diagnostic software, special arrangements, or test “jigs” that might be required. If you will be doing statistical measures, indicate the number of samples you will test. The point here is to keep your end goal in mind right from the start of the project.

**Technical Design**

**Possible Solutions and Design Alternatives**

In this section, you explore and discuss different possible solutions and design alternatives. Exploring possibilities is often neglected by designers eager to start on the first idea that comes to mind. Often, however, the first solution isn’t the best. For instance, you may have in mind an implementation using a keyboard, but when you work back to the requirements you may realize that it is only the user control aspect that is required, and thus you can do it all from the attached personal computer. The key to designing is coming up with alternatives, and it is in exploring alternatives that you come to appreciate the inevitable design trade-offs that you will face.
Some alternatives may differ only in small variations in implementation, others may be quite different. You should provide enough of an evaluation of each choice to justify your selection of the proposed solution. Provide a preliminary assessment of the different design alternatives in terms of the project goal and requirements you've laid out. Create a comparison table if necessary [See ECE298 notes, Chapter 9 for more ideas].

You may find that this section and the next naturally collapse into a single section, or that you wish to keep them separate.

**Assessment of Proposed Solution**

Comment about the strengths, weaknesses, and trade-offs made in the proposed solution. What reasons led you to choose this solution over some of the others you explored? This section does not need to be long, but ensures that you can provide some justification for your design decisions to date.

**Describing an Initial Technical Design**

Once you have explored a few design alternatives and their associated trade-offs, you can proceed to propose an initial technical design based on your best design ideas. Do not rush into this stage; even in the final draft of your Project Proposal, you can make the proposed design suitably open to give you the flexibility to define uncertain aspects later. The key is to begin breaking down the overall design into smaller modules and design tasks in order to develop an initial work plan.

**System-level Overview**

Begin by summarizing the entire design at the highest level. You may, for instance, explain the principle of operation, the algorithm, or the process flow or stages of an investigation of a more research-oriented project. Make clear if the approach chosen is based on existing, well established technology or innovative ideas. If your approach is based on existing work, you do not need to provide a detailed explanation; simply point out the approach you wish to use and back it up with a relevant reference.

Provide a **System Block Diagram** that breaks down the overall design into its key modules or blocks. Label all inputs and outputs of each module. Modules should have single purpose, be easily described, and should represent a unit that can be designed separately and assigned to an individual team member. [see ECE298 notes: Section 6.2 Block Diagrams] [see Salt & Rothery, Section 4.4 Block Diagram Basics] [Ford & Coulston, Chapter 5]. Also see ECE298 notes, Section 5.5 UML2 for ideas on a variety of different diagrams (e.g. state machine, interaction diagrams) you can use to best represent the operation of your system design and/or its modules.

*Updated Oct 6, 2008*
Module-level Descriptions

Describe or define each module in the system block diagram. Provide enough detail that it is clear how they work with each other in the system. You should also make clear any module requirements where the module affects the adherence of the system to the overall requirements. Also define the inputs and outputs of each module (e.g., RS-232 protocol) [see Ford & Coulston, Chapter 5] [see Salt & Rothery, Section 4.5, and Section A.4.7 for examples].

Work Plan

This section focuses on managing your project. How do you plan to divide up and schedule the work, and how can you adapt your project and/or work plan if you run into difficulties? Here are the key elements of a work plan:

- A work breakdown structure (WBS)
- A Gantt chart or plan that indicates a schedule of delivery of parts of your project
- A financial plan
- A Feasibility Assessment

These elements are described in the sections that follow.
A Work Breakdown Structure (WBS)

Introduced in ECE298 [ECE298 notes, Section 10.2], a Work Breakdown Structure (WBS) is a hierarchical representation of all the tasks that must be accomplished to complete a design project.

Example: WBS for weekly lawn maintenance

<table>
<thead>
<tr>
<th>Task #</th>
<th>Task</th>
<th>Jack</th>
<th>Jane</th>
<th>John</th>
</tr>
</thead>
<tbody>
<tr>
<td>o</td>
<td>Cut Grass</td>
<td></td>
<td></td>
<td>R</td>
</tr>
<tr>
<td>1</td>
<td>Cut front lawn</td>
<td></td>
<td></td>
<td>R</td>
</tr>
<tr>
<td>2</td>
<td>Cut back lawn</td>
<td></td>
<td></td>
<td>R</td>
</tr>
<tr>
<td>3</td>
<td>Cut sides</td>
<td></td>
<td></td>
<td>R</td>
</tr>
<tr>
<td>o</td>
<td>Trim Edges</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Trim property boundaries</td>
<td></td>
<td></td>
<td>R</td>
</tr>
<tr>
<td>5</td>
<td>Trim around garden</td>
<td></td>
<td></td>
<td>R</td>
</tr>
<tr>
<td>6</td>
<td>Trim around trees</td>
<td></td>
<td></td>
<td>R</td>
</tr>
<tr>
<td>o</td>
<td>Trim Bushes</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Prune side hedges</td>
<td></td>
<td>R</td>
<td>A</td>
</tr>
<tr>
<td>8</td>
<td>Prune back hedge</td>
<td></td>
<td></td>
<td>R</td>
</tr>
</tbody>
</table>

R = Responsible, A = Assisting

The above example illustrates the decomposition of work into manageable elements, each of which could be performed by an individual and each of which can be traced to a measurable completion in support of completing the overall job. Note that there is no overlap or duplication of activities.

WBS Checklist:

- Assign the responsibility of a task to only one person. This does not mean you cannot assist one another. In the end, however, each student is responsible for reporting a clear set of tasks and for showing a clear individual contribution to the project. The person responsible for a task should be the dominant contributor. Break down the task if it is too large for one person to complete, and reassign tasks if necessary. Tasks should take 1-3 weeks of time during the term (assuming that all your courses are equally loading).
- Each task should have both a number and a description for readability and for easy referencing in the Gantt chart and in future reports.
- Ensure each task has a clear starting point, end point, and a verifiable/measurable result.

Updated Oct 6, 2008
Gantt Chart

Introduced in ECE298, the Gantt Chart presents a scheduling of the tasks in a WBS [ECE298 notes, Section 10.3]. Continuing with the Lawn maintenance example, below are two sample Gantt charts that illustrate the effect of the number of people on the scheduling of tasks

<table>
<thead>
<tr>
<th>Perform Weekly Lawn Maintenance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cut Grass</td>
</tr>
<tr>
<td>1 Cut front lawn</td>
</tr>
<tr>
<td>2 Cut back lawn</td>
</tr>
<tr>
<td>3 Cut sides</td>
</tr>
<tr>
<td>Trim Edges</td>
</tr>
<tr>
<td>4 Trim property boundaries</td>
</tr>
<tr>
<td>5 Trim around garden</td>
</tr>
<tr>
<td>6 Trim around trees</td>
</tr>
<tr>
<td>Trim Bushes</td>
</tr>
<tr>
<td>7 Prune side hedges</td>
</tr>
<tr>
<td>8 Prune back hedge</td>
</tr>
</tbody>
</table>

Figure 2: Gantt Chart if one person does the Lawn Maintenance.

<table>
<thead>
<tr>
<th>Perform Weekly Lawn Maintenance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cut Grass</td>
</tr>
<tr>
<td>1 Cut front lawn</td>
</tr>
<tr>
<td>2 Cut back lawn</td>
</tr>
<tr>
<td>3 Cut sides</td>
</tr>
<tr>
<td>Trim Edges</td>
</tr>
<tr>
<td>4 Trim property boundaries</td>
</tr>
<tr>
<td>5 Trim around garden</td>
</tr>
<tr>
<td>6 Trim around trees</td>
</tr>
<tr>
<td>Trim Bushes</td>
</tr>
<tr>
<td>7 Prune side hedges</td>
</tr>
<tr>
<td>8 Prune back hedge</td>
</tr>
</tbody>
</table>

Figure 3: Gantt Chart if three people do the same Lawn Maintenance with their own set of equipment. Note that ‘Trim Edges’ cannot be done until the grass has been cut and that having a team of three does not cut the time required by a factor of three in due to the logical dependencies.

The work elements are logically sequenced in time. Some work may be concurrent. Each task generally has predecessor task(s) and successor task(s). To create your Gantt chart, a sample template using Microsoft Excel can be found here. You can also use a standard scheduling software program such as Microsoft Project Manager (available in the ECS Windows facilities).

Gantt chart Checklist:
- For readability, fit your Gantt chart onto a single page. If there are too many tasks on the WBS to fit onto a single sheet, include only the most important and/or combine related tasks into a single item.
- Label each task on the Gantt chart with the person that is responsible. Alternatively, you can use a different bar PATTERN for each person. Do NOT use different COLOURS as they are hard to distinguish in black in white printouts.

Updated Oct 6, 2008
Apart from holidays, there typically should be no gaps or 'dead time' for any team member.

Every element should have allowance for setup, testing and rework. This is particularly true of the system integration, where modules may need revamping when they don’t “fit” together.

Avoid cluttering up the Gantt chart with tasks relating to the course deliverables (documents, posters, presentations). Writing reports and giving presentations are understood to be part of your work. If you wish to point these out, you can simply mark the due dates down as milestones.

Is the work duration longer than 4 weeks (or so)? If so, the task should probably be broken down into smaller tasks. Generally, smaller duration tasks are more easily measurable and controllable. Long duration tasks tend to “hide” progress or worse “lack of progress”.

Alternatives to a Gannt chart are acceptable, provided they show a clear path to project completion with measurable, dated module delivery points.

It is expected that things will change. Order of execution may change; tasks may be done faster or slower than first expected; technical problems and their solutions will alter things. However, the Gannt chart should show that you have thought about every step in the proposed process, and have come to realistic (although initial) determinations of time and effort of these steps.

Financial Plan

This section documents the costs of the project, which can include parts, computer hardware, software licenses, rental costs, etc. The Financial Plan consists of a budget table and an explanation of contingency arrangements if the necessary funding for the project is not acquired. You need not include your time, but should include “free” items that would cost money in industry, budgetted at $0.

Budget Table

All budgets should be prepared in accordance with the following set of rules:

1. Each student is required to cover at least the first $100 of expenses from their design project. Apart from help from their supervisors, the department also has a special budget to support students with purchases towards their design projects. The budget is limited, but all teams can apply and funding will be awarded based on the strength of your justification for funding. Any rewarded money will not be available until considerably later in the project, so you or your supervisor will have to purchase the items. Make sure you have a contingency plan in place in case you do not receive funding.

2. List as separate items the expected amount contributed by the students, the supervisor, and the industrial sponsor (if applicable).

3. Determine the amount requested from the Design Centre: subtract the net cost from the net contributions.
4. Flag those components/assemblies that you or a group member wish to keep yourself at the conclusion of the course. These items should be put in as $0.

5. Identify the items of higher priority and give a short explanation regarding your contingency arrangements in case you are not successful in receiving the funds or receive only partial support (see below). Example:

"Priority 1) GPS Receiver: we propose to create logic that represents the signal coming from the GPS receiver in case we are not able to obtain funds to purchase the GPS receiver. This will require the following changes to our Technical Solution, Work Plan, and Financial Plan ..."

**Note:**
- A suitable format for the budget request is shown [here](#).
- The process for actually requesting funding from the Design Centre is separate from this report. Students should refer to the Budgets and Funding Requests page found [here](#) on the course website for detailed instructions.
- For services from a technician or contractor, you should provide a cost breakdown and detailed work plan submitted by the contractor.

**Feasibility Assessment**

This section is meant to help your team, supervisor, and administrator assess the feasibility of your proposed project. This is not a marketing exercise: try to provide a fair and honest assessment of your proposal, balancing both its strengths and weaknesses. There is nothing wrong with identifying major deficiencies in your project; in some businesses, fewer than one in ten projects results in a commercially viable product. Identifying weaknesses and putting together a plan to address those weaknesses early on is a crucial part of the design process. It also helps your supervisor and administrator in their roles as effective mentors and guides.

Here are some of the key issues you should address in this section. Be brief - a sentence or two is probably enough to cover each issue. Also, these issues do not need to be addressed in any particular order and may be combined or reorganized to flow logically:

**Skills and resources:**
- What are the key skills, knowledge and resources you need for this project?
- What portions have you already acquired and what portions are currently lacking? How do you plan to obtain what you still need? Examples:
  - From the web: free or open source software, technical standards, expert forums
  - From your supervisor: graduate researchers, lab space and equipment, etc.
Risk Assessment:

In this section, describe the risks that the project could face (risk identification) and how you plan to deal with them (risk mitigation). An example of a risk would be that a particular component you envision may be impossible to implement, and a corresponding risk mitigation strategy would be attempting to prototype the riskiest portion of your project as a feasibility assessment of the whole project. This would be coupled with a ‘fall-back’ plan as to what you would do should this prototype fail. Merely stating that risks will not occur, or that risks will be mitigated by working harder does NOT constitute back-up plan!

This section should not be very long and you should focus on one or two real risks to your project (most likely technical risks but there could be others as well). Minor risks that will cause little disruption in schedule do not need to be addressed. Note that something that is technically challenging (or difficult to implement) may not necessarily be a significant risk to the project, if its failure does not affect the overall project goals or requirements (for example, the task may relate to a project objective for an additional feature, rather than a core requirement).

**Note:** when addressing risks, focus on the most likely ones that are specific to your project. Some students ponder the risks of having a team member drop out of school, or losing all their work due to a computer crash. Such discussions aren't particularly helpful in planning your project. A more specific and effective series of questions might be

- What happens to other components and to the project if component X that I’ve designed for my system fails to meet specifications or takes significantly longer to develop?
- Can I change the specifications, demonstrate a lower performance system, or remove some features of my final design and still maintain the essential aspects of my project?
- What if our initial plan to build a real prototype proves unfeasible? Could we demonstrate our design or part of our design using a computer model instead? How would the limitations of this computer model-based prototype be? How would the project goal, requirements, and scope be modified to ensure that the new, redefined, project remains challenging?

The key idea is to think of ways that you can modify the scope of your project so that you can show some partial success in realizing your Project Proposal by the end of the school year. More information and additional examples in [ECE298 notes, Chapter 11].

**Risk in Research Projects:** Often, a research project will have above-average risk and this section may need to be longer. If the ‘Technical Design’ section describes your intended initial strategy, this section should describe alternate directions that will be
taken if experimental results indicate that the initial strategy is no longer what should be done. Here, the ‘risk’ is that the experimental result or some intermediate result not be as expected (and the probability of this could be high) and the mitigation is the determination of an alternate goal or an alternate route to the original goal.

3. References

Good references are an important part of documenting your work. Use original sources such as books, journals, and standards publications wherever possible. Minimize your use of web references, which are generally unreliable. References should be listed in the order they appear in the text, in IEEE form. Refer to http://www.ecf.utoronto.ca/~writing/handbook-docum1b.html. An excerpt from the IEEE author information kit is included here.

Appendices (for final draft)

Appendix A: Student-supervisor agreement form

The agreement is available in Word or PDF format (click on either format to download file). The agreement must be signed by your group and your supervisor, and must be included in the hard copy of the final Project Proposal draft. It is not required for the electronic copy.

Appendix B: Draft B Evaluation Form (Completed by the Engineering Communication Centre)

Draft B of the Project Proposal will not be graded, but will be reviewed and discussed in a meeting between your group and a member of the Engineering Communication Centre (ECP) to provide you feedback for preparing the final draft. When you submit Draft B, sign-up for an appointment at the ECP office. The sign-up instruction is here. The deadline for booking an appointment and submitting your draft version can be found here.

The evaluation form for Draft B is used to keep track of feedback given to students by tutors in the ECC. The tutor will fill out and return the evaluation form to you at the end of your workshop session. You will then append the completed form as Appendix B of your final Project Proposal draft, allowing the administrator and your supervisor(s) to get a sense of the issues that were – or were not – discussed.

Appendix C: Report Attribution Table

The report attribution table summarizes the contribution of each team member to the project proposal. It is available in Word or PDF format. Complete the table, showing the initials of each team member in a separate column, and using the abbreviations shown. This sheet must be signed by all group members.

Updated Oct 6, 2008
Other Appendices

Put into appendices all material that is supportive to the main body of the report and that you feel a portion of your readership may find useful to be convinced of your positions, but that is background, that is too bulky for the body of the report, or which is not your own work. The appendix material must be referenced in the main body of the report, and not just “tacked-on”. Examples of relevant materials are: manufacturers' data sheets, a lengthy computer program or part thereof, subject consent forms, primary data (when it is too voluminous), "dead ends" that you nevertheless think are important for the record. By putting material into an appendix you may improve the flow of thought in the main body of the report.
